

# Woolly mammoth

Majestic mammoths once roamed in herds across the ice age plains of North America, Europe, and Asia. Mammoths were closely related to modern elephants—in fact, studies of frozen mammoths found in Siberia show their DNA was almost identical to that of living elephants. There were eight species of mammoth, of which the most famous is the woolly mammoth, which died out only 3,700 years ago.

*Hair grew up to  
3 ft (90 cm) long*
