

► A REMOTE LOCATION *A team of scientists camped at the place Lyuba was found a year after her discovery to gather more clues about her life and death.*

LET'S INVESTIGATE!

Following Lyuba's discovery, an international team of scientists set to work to build up a picture of what her life would have been like. Scientists from Russia, France, Japan, and the United States took samples and X-rays. They all concluded that Lyuba was in healthy condition before she died and that her death was the result of her accidentally slipping into mud.

Scientists hope to bring mammoths back to life by using DNA from frozen bodies.

TESTS, TESTS, TESTS

Lyuba underwent numerous tests, first at a medical school in Japan, and then back in Russia. Her state of preservation was amazing: scientists were able to look closely at her skin, her eyes, her teeth, her organs, and her eyelashes. Even some of her fur was still present. Allowing her body to defrost slightly and for a short time meant that tissue samples could be removed. The scientists dealing with her wore protective clothing to prevent contamination.
