

FOSSILIZED IN AMBER

Millions of years ago, these insects were trapped in a honey-colored goo: pine tree resin. Over time, the resin hardened into amber, preserving the insects so well that even the fine veins in their wings are visible. They look as if they lived yesterday, but these fossilized insects are thought to be around 38 million years old.

▼ TRAPPED *All kinds of insects have been captured in amber, including mantids such as this one, and a wide variety of flies.*
