

The “X” model shows the link between what goes on internally and externally. Opposite sides of the body criss-cross, attaching the limbs and head to the torso.

The inner unit is the foundation of our body. It houses our center of gravity. Anchoring this area provides a counterbalance to, and increased effectiveness for, each stretch.

Attention to stretching the lateral system is a major key in balancing the body. Our right- or left-handed dominance presents a challenge when it comes to achieving optimal posture.

The lateral system extends from the triceps in the arm to the side of the foot.
