

Test the mobility of your shoulders and upper back. Lie on the floor with your arms bent and your forearms parallel with the sides of your head. Your muscles are over-tight if your head and forearms do not touch the floor.

Test the mobility of your spine, rib cage, and neck.

From a seated position, cross your arms, put each hand on the opposite shoulder and rotate your torso. Note how far you can go. Anything less than 35° indicates that your muscles are over-tight. Being right-handed or left-handed affects how far you can rotate.

Test the mobility of your hips. Lie on your back and raise first one leg then the other. If you can only raise your leg to a 70° angle or less, it indicates over-tightness of your muscles at the back of your leg and hip. Being able to lift each leg to a 90° angle helps prevent low back pain when sitting. It also prevents walking with an unbalanced gait, which causes leg and back problems. Raising your leg to a 120° angle indicates an exceptional degree of mobility.
