

◀ MAXIM .45IN GARDNER-GATLING CALIBER

Date 1892

Origin UK

Barrel 44in (112cm)

Caliber .45in

The British Army's .45in Maxim gun had become the standard Maxim gun by the late 19th century. It was converted to .303in caliber from 1897–98 onward. The Royal Navy, however, continued with the .45in Gardner-Gatling caliber gun until the end of World War I. This was mainly because these machine-guns, even the higher-caliber ones, would be fixed to a ship's structure and did not need to be moved. The .45in caliber gave the naval Maxim guns greater range and penetrating power. These weapons fired about 450 rounds per minute.

▼ MAXIM-NORDENFELT MODEL 1893

Date 1893

Origin UK

Barrel 42½in (108cm)

Caliber 11mm

Hiram Maxim and Swedish gunmaker Nordenfelt entered into partnership in 1888. In this early experimental model, intended for French trials, steam pressure was used to operate the firing mechanism of the gun when the trigger was pulled—an impractical refinement that was soon discontinued. This model fired 450 rounds per minute. In 1896, their joint venture was subsumed into Vickers, Sons and Maxim.
